

Dear Khalifa Salim,

I hope you are doing well.

I am writing to apply for the Junior Software Engineer position. To keep my cover letter on point, this is split into three parts, a brief overview of why I am looking for a new position, what my strengths are, and how I can fit in at this position.

Most recently, I worked at Morpheus Space, where I co-led the development and stabilization of production software in the aerospace sector. Prior to that, I developed full-stack web applications, automation platforms, ETL pipelines, and backend services using Python, JavaScript, SQL, and Linux. Due to company-wide budget reductions, my position at Morpheus Space was recently eliminated. I am now looking for an opportunity where engineers are encouraged to take ownership, and where continuous learning is encouraged.

Below is a summary of what I bring and how it aligns with your requirements:

My Strengths	How this helps the team
Full-Stack Development	Experience building and maintaining web applications using Python, Django, React, JavaScript, REST APIs, ETL Pipelines and SQL databases.
Product Ownership Mindset	Comfortable taking features from requirements through implementation, testing, deployment, and iteration while keeping user value at the center of decision-making.
AI-Assisted Development	Actively leverage modern AI tools such as GitHub Copilot, OpenAI, and Claude to improve development productivity while maintaining code quality and engineering judgment.
Startup & Cross-Functional Collaboration	Experience working in fast-paced environments alongside engineers, stakeholders, and business teams to deliver production-ready software.

Thank you for your time and consideration.

Kind regards,
Sai Pranavi Kasichainula
